# Data Science Regression Project: Predicting Home Prices in Banglore

Dataset is downloaded from here: https://www.kaggle.com/amitabhajoy/bengaluru-house-price-data

```
import pandas as pd
import numpy as np
from matplotlib import pyplot as plt
%matplotlib inline
import matplotlib
matplotlib.rcParams["figure.figsize"] = (20,10)
```

#### Data Load: Load banglore home prices into a dataframe

```
df1 = pd.read_csv("bengaluru_house_prices.csv")
df1.head()
```

	area_type	availability	location	size	society	total_sqft	bath	balcony	price
0	Super built- up Area	19-Dec	Electronic City Phase II	2 BHK	Coomee	1056	2.0	1.0	39.07
1	Plot Area	Ready To Move	Chikka Tirupathi	4 Bedroom	Theanmp	2600	5.0	3.0	120.00
2	Built-up Area	Ready To Move	Uttarahalli	3 BHK	NaN	1440	2.0	3.0	62.00
3	Super built- up Area	Ready To Move	Lingadheeranahalli	3 BHK	Soiewre	1521	3.0	1.0	95.00
4	Super built- up Area	Ready To Move	Kothanur	2 BHK	NaN	1200	2.0	1.0	51.00

```
dfl.shape
```

```
dfl.columns
```

```
df1['area_type'].unique()
```

```
df1['area_type'].value_counts()
Super built-up Area 8790
```

Built-up Area 2418

(13320, 9)

```
Plot Area 2025
Carpet Area 87
Name: area type, dtype: int64
```

#### Drop features that are not required to build our model

```
df2 = df1.drop(['area_type','society','balcony','availability'],axis='columns')
df2.shape
(13320, 5)
```

## Data Cleaning: Handle NA values

```
df2.isnull().sum()
location
               1
              16
size
total sqft
               0
              73
bath
price
dtype: int64
df2.shape
(13320, 5)
df3 = df2.dropna()
df3.isnull().sum()
location
              0
size
              0
total sqft
              0
bath
              0
price
dtype: int64
df3.shape
(13246, 5)
```

#### Feature Engineering

Add new feature(integer) for bhk (Bedrooms Hall Kitchen)

```
df3['bhk'] = df3['size'].apply(lambda x: int(x.split(' ')[0]))
df3.bhk.unique()
```

 $\label{lem:c:programDataAnaconda3} Iib\site-packages\ipykernel\_launcher.py:1: SettingWithCopyWarning:$ 

A value is trying to be set on a copy of a slice from a DataFrame. Try using .loc[row\_indexer,col\_indexer] = value instead

See the caveats in the documentation: http://pandas.pydata.org/pandas-docs/stable /indexing.html#indexing-view-versus-copy

```
array([ 2, 4, 3, 6, 1, 8, 7, 5, 11, 9, 27, 10, 19, 16, 43, 14, 12, 13, 18], dtype=int64)
```

#### Explore total\_sqft feature

```
def is_float(x):
    try:
        float(x)
    except:
        return False
    return True
```

```
2+3
```

5

```
df3[~df3['total_sqft'].apply(is_float)].head(10)
```

	location	size	total_sqft	bath	price	bhk
30	Yelahanka	4 BHK	2100 - 2850	4.0	186.000	4
122	Hebbal	4 BHK	3067 - 8156	4.0	477.000	4
137	8th Phase JP Nagar	2 BHK	1042 - 1105	2.0	54.005	2
165	Sarjapur	2 BHK	1145 - 1340	2.0	43.490	2
188	KR Puram	2 BHK	1015 - 1540	2.0	56.800	2
410	Kengeri	1 BHK	34.46Sq. Meter	1.0	18.500	1
549	Hennur Road	2 BHK	1195 - 1440	2.0	63.770	2
648	Arekere	9 Bedroom	4125Perch	9.0	265.000	9
661	Yelahanka	2 BHK	1120 - 1145	2.0	48.130	2
672	Bettahalsoor	4 Bedroom	3090 - 5002	4.0	445.000	4

Above shows that total\_sqft can be a range (e.g. 2100-2850). For such case we can just take average of min and max value in the range. There are other cases such as 34.46Sq. Meter which one can convert to square ft using unit conversion. I am going to just drop such corner cases to keep things simple

```
def convert_sqft_to_num(x):
    tokens = x.split('-')
    if len(tokens) == 2:
        return (float(tokens[0])+float(tokens[1]))/2
    try:
        return float(x)
    except:
        return None
```

```
df4 = df3.copy()
df4.total_sqft = df4.total_sqft.apply(convert_sqft_to_num)
df4 = df4[df4.total_sqft.notnull()]
df4.head(2)
```

	location	size	total_sqft	bath	price	bhk
0	Electronic City Phase II	2 BHK	1056.0	2.0	39.07	2
1	Chikka Tirupathi	4 Bedroom	2600.0	5.0	120.00	4

#### For below row, it shows total\_sqft as 2475 which is an average of the range 2100-2850

```
df4.loc[30]
location
              Yelahanka
                  4 BHK
size
                   2475
total_sqft
bath
                      4
                     186
price
bhk
Name: 30, dtype: object
(2100+2850)/2
```

2475.0

## **Feature Engineering**

#### Add new feature called price per square feet

```
df5 = df4.copy()
df5['price_per_sqft'] = df5['price']*100000/df5['total_sqft']
df5.head()
```

	location	size	total_sqft	bath	price	bhk	price_per_sqft
0	Electronic City Phase II	2 BHK	1056.0	2.0	39.07	2	3699.810606
1	Chikka Tirupathi	4 Bedroom	2600.0	5.0	120.00	4	4615.384615
2	Uttarahalli	3 BHK	1440.0	2.0	62.00	3	4305.555556
3	Lingadheeranahalli	3 BHK	1521.0	3.0	95.00	3	6245.890861
4	Kothanur	2 BHK	1200.0	2.0	51.00	2	4250.000000

```
df5_stats = df5['price_per_sqft'].describe()
df5_stats
```

```

### **Dimensionality Reduction**

Any location having less than 10 data points should be tagged as "other" location. This way number of categories can be reduced by huge amount. Later on when we do one hot encoding, it will help us with having fewer dummy columns

```
location stats less than 10 = location stats[location stats<=10]</pre>
location stats less than 10
                                                       10

#### **Outlier Removal Using Business Logic**

As a data scientist when you have a conversation with your business manager (who has expertise in real estate), he will tell you that normally square ft per bedroom is 300 (i.e. 2 bhk apartment is minimum 600 sqft. If you have for example 400 sqft apartment with 2 bhk than that seems suspicious and can be removed as an outlier. We will remove such outliers by keeping our minimum thresold per bhk to be 300 sqft

```
df5[df5.total_sqft/df5.bhk<300].head()
```

	location	size	total_sqft	bath	price	bhk	price_per_sqft
9	other	6 Bedroom	1020.0	6.0	370.0	6	36274.509804
45	HSR Layout	8 Bedroom	600.0	9.0	200.0	8	33333.333333
58	Murugeshpalya	6 Bedroom	1407.0	4.0	150.0	6	10660.980810
68	Devarachikkanahalli	8 Bedroom	1350.0	7.0	85.0	8	6296.296296
70	other	3 Bedroom	500.0	3.0	100.0	3	20000.000000

Check above data points. We have 6 bhk apartment with 1020 sqft. Another one is 8 bhk and total sqft is 600. These are clear data errors that can be removed safely

```
df5.shape

(13200, 7)

df6 = df5[~(df5.total_sqft/df5.bhk<300)]
    df6.shape

(12456, 7)</pre>
```

#### Outlier Removal Using Standard Deviation and Mean

```
max 176470.588235
Name: price_per_sqft, dtype: float64
```

Here we find that min price per sqft is 267 rs/sqft whereas max is 12000000, this shows a wide variation in property prices. We should remove outliers per location using mean and one standard deviation

```
def remove_pps_outliers(df):
    df_out = pd.DataFrame()
    for key, subdf in df.groupby('location'):
        m = np.mean(subdf.price_per_sqft)
        st = np.std(subdf.price_per_sqft)
        reduced_df = subdf[(subdf.price_per_sqft>(m-st)) & (subdf.price_per_sqft
    df_out = pd.concat([df_out,reduced_df],ignore_index=True)
    return df_out

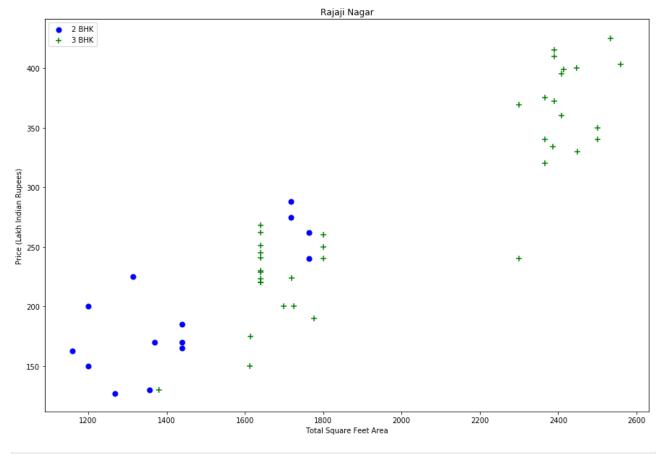

df7 = remove_pps_outliers(df6)
df7.shape

(10242, 7)
```

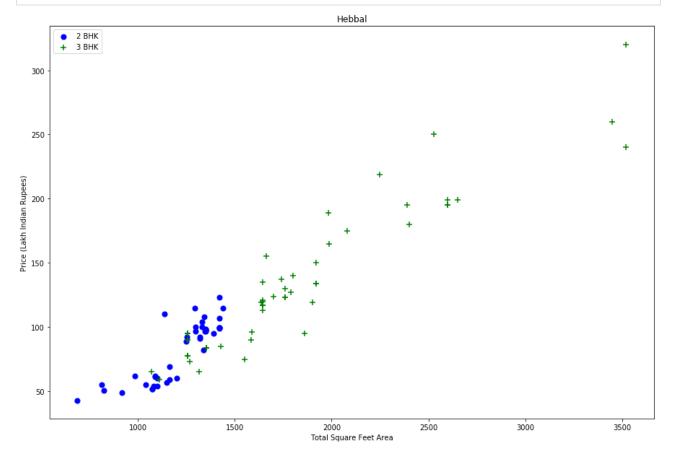

Let's check if for a given location how does the 2 BHK and 3 BHK property prices look like

```
def plot_scatter_chart(df,location):
    bhk2 = df[(df.location==location) & (df.bhk==2)]
    bhk3 = df[(df.location==location) & (df.bhk==3)]
    matplotlib.rcParams['figure.figsize'] = (15,10)
    plt.scatter(bhk2.total_sqft,bhk2.price,color='blue',label='2 BHK', s=50)
    plt.scatter(bhk3.total_sqft,bhk3.price,marker='+', color='green',label='3 BHK
    plt.xlabel("Total Square Feet Area")
    plt.ylabel("Price (Lakh Indian Rupees)")
    plt.title(location)
    plt.legend()

plot_scatter_chart(df7,"Rajaji Nagar")
```

We should also remove properties where for same location, the price of (for example) 3 bedroom apartment is less than 2 bedroom apartment (with same square ft area). What we will do is for a given location, we will build a dictionary of stats per bhk, i.e.

```
{
    '1' : {
        'mean': 4000,
        'std: 2000,
        'count': 34
    },
    '2' : {
        'mean': 4300,
        'std: 2300,
        'count': 22
    },
}
```

Now we can remove those 2 BHK apartments whose price\_per\_sqft is less than mean price per sqft of 1 BHK apartment

```
def remove bhk outliers(df):
    exclude indices = np.array([])
    for location, location df in df.groupby('location'):
        bhk stats = {}
        for bhk, bhk df in location df.groupby('bhk'):
            bhk stats[bhk] = {
                 'mean': np.mean(bhk df.price per sqft),
                 'std': np.std(bhk_df.price_per_sqft),
                 'count': bhk df.shape[0]
        for bhk, bhk df in location df.groupby('bhk'):
            stats = bhk stats.get(bhk-1)
            if stats and stats['count']>5:
                exclude indices = np.append(exclude indices, bhk df[bhk df.price
    return df.drop(exclude indices,axis='index')
df8 = remove bhk outliers(df7)
# df8 = df7.copy()
df8.shape
(7317, 7)
```

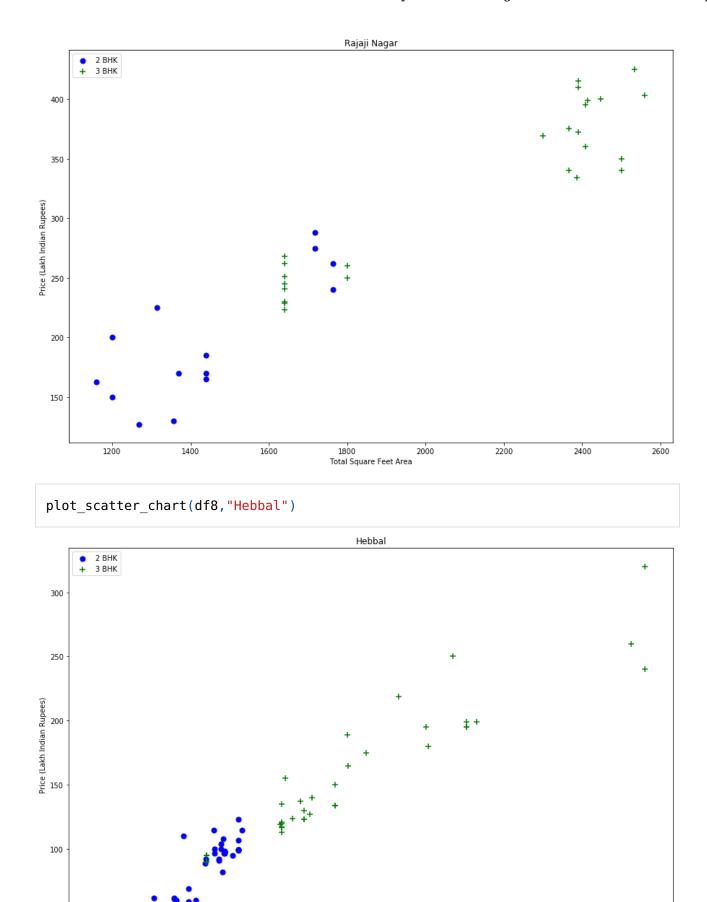

Plot same scatter chart again to visualize price\_per\_sqft for 2 BHK and 3 BHK properties

```
plot_scatter_chart(df8,"Rajaji Nagar")
```

50

1000

1500

Based on above charts we can see that data points highlighted in red below are outliers and they are being removed due to remove\_bhk\_outliers function

2000

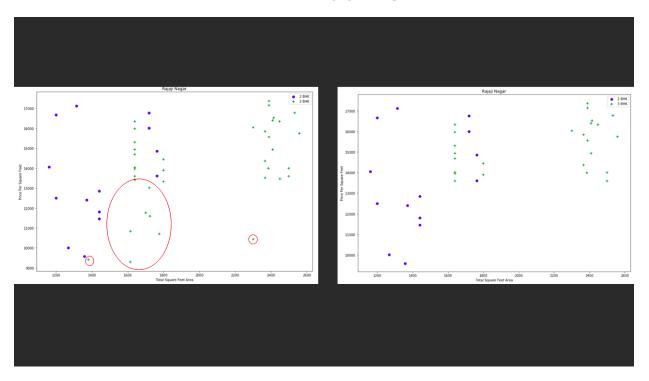

Total Square Feet Area

2500

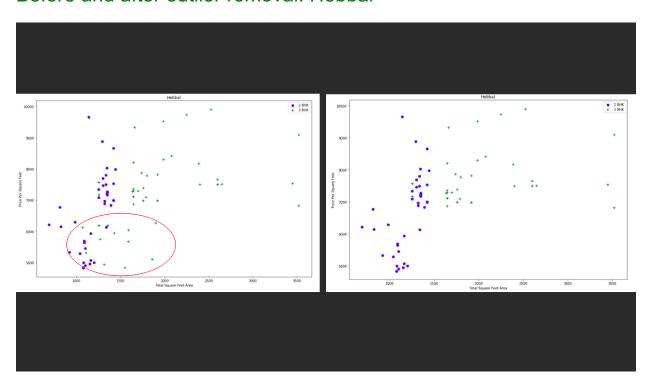

3000

3500

## Before and after outlier removal: Rajaji Nagar

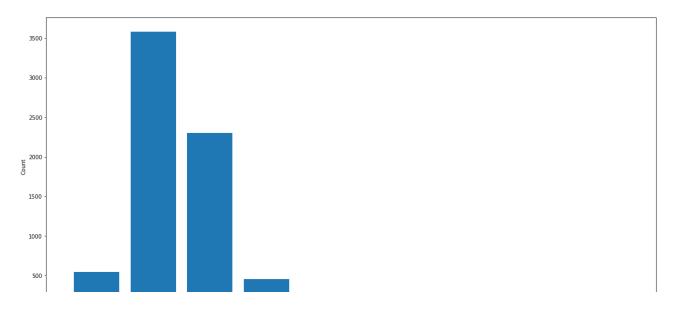

#### Before and after outlier removal: Hebbal

```
import matplotlib
matplotlib.rcParams["figure.figsize"] = (20,10)
plt.hist(df8.price_per_sqft,rwidth=0.8)
plt.xlabel("Price Per Square Feet")
plt.ylabel("Count")
```

Text(0, 0.5, 'Count')

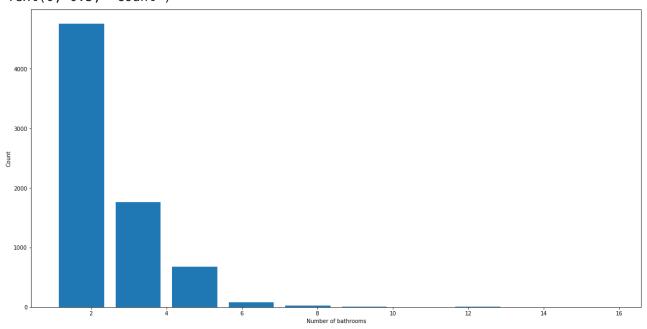

## Outlier Removal Using Bathrooms Feature

```
df8.bath.unique()
array([ 4., 3., 2., 5., 8., 1., 6., 7., 9., 12., 16., 13.])

plt.hist(df8.bath,rwidth=0.8)
plt.xlabel("Number of bathrooms")
plt.ylabel("Count")
```

Text(0, 0.5, 'Count')

df8[df8.bath>10]

	location	size	total_sqft	bath	price	bhk	price_per_sqft
5277	Neeladri Nagar	10 BHK	4000.0	12.0	160.0	10	4000.000000
8483	other	10 BHK	12000.0	12.0	525.0	10	4375.000000
8572	other	16 BHK	10000.0	16.0	550.0	16	5500.000000

```
        Jocation
        size
        total_sqft
        bath
        price
        bhk
        price_per_sqft

        9306
        other
        11 BHK
        6000.0
        12.0
        150.0
        11
        2500.000000
```

It is unusual to have 2 more bathrooms than number of bedrooms in a home

df8[df8.bath>df8.bhk+2]

	location	size	total_sqft	bath	price	bhk	price_per_sqft
1626	Chikkabanavar	4 Bedroom	2460.0	7.0	80.0	4	3252.032520
5238	Nagasandra	4 Bedroom	7000.0	8.0	450.0	4	6428.571429
6711	Thanisandra	3 BHK	1806.0	6.0	116.0	3	6423.034330
8408	other	6 BHK	11338.0	9.0	1000.0	6	8819.897689

Again the business manager has a conversation with you (i.e. a data scientist) that if you have 4 bedroom home and even if you have bathroom in all 4 rooms plus one guest bathroom, you will have total bath = total bed + 1 max. Anything above that is an outlier or a data error and can be removed

```
df9 = df8[df8.bath<df8.bhk+2]
df9.shape</pre>
```

(7239, 7)

df9.head(2)

	location	size	total_sqft	bath	price	bhk	price_per_sqft

2 rows × 244 columns

#### Build a Model Now...

```
df12.shape
```

(7239, 244)

```
X = df12.drop(['price'],axis='columns')
X.head(3)
```

						Judicial Layout		Hbr Layout			
0	2850.0	4.0	4	1	0	0	0	0	0	0	 (
1	1630.0	3.0	3	1	0	0	0	0	0	0	 (
2	1875.0	2.0	3	1	0	0	0	0	0	0	 (

3 rows × 243 columns

```
X. shape
(7239, 243)
y = df12.price
y.head(3)
     428.0
1
     194.0
     235.0
Name: price, dtype: float64
len(y)
7239
from sklearn.model_selection import train_test_split
X_train, X_test, y_train, y_test = train_test_split(X,y,test_size=0.2,random_stat
from sklearn.linear_model import LinearRegression
lr clf = LinearRegression()
lr clf.fit(X train,y train)
lr_clf.score(X_test,y_test)
```

0.8629132245229449

## Use K Fold cross validation to measure accuracy of our LinearRegression model

```
from sklearn.model_selection import ShuffleSplit
from sklearn.model selection import cross val score
cv = ShuffleSplit(n_splits=5, test_size=0.2, random_state=0)
cross val score(LinearRegression(), X, y, cv=cv)
```

array([0.82702546, 0.86027005, 0.85322178, 0.8436466 , 0.85481502])

We can see that in 5 iterations we get a score above 80% all the time. This is pretty good but we want to test few other algorithms for regression to see if we can get even better score. We will use GridSearchCV for this purpose

#### Find best model using GridSearchCV

```
from sklearn.model selection import GridSearchCV
from sklearn.linear model import Lasso
from sklearn.tree import DecisionTreeRegressor
def find best model using gridsearchcv(X,y):
    algos = {
        'linear regression' : {
             'model': LinearRegression(),
             'params': {
                 'normalize': [True, False]
        'lasso': {
             'model': Lasso(),
             'params': {
                 'alpha': [1,2],
                 'selection': ['random', 'cyclic']
        },
         decision tree': {
             'model': DecisionTreeRegressor(),
             'params': {
                 'criterion' : ['mse','friedman_mse'],
'splitter': ['best','random']
            }
        }
    }
    scores = []
    cv = ShuffleSplit(n splits=5, test size=0.2, random state=0)
    for algo name, config in algos.items():
        gs = GridSearchCV(config['model'], config['params'], cv=cv, return train
        gs.fit(X,y)
        scores.append({
             'model': algo_name,
             'best score': gs.best score ,
             'best params': gs.best_params_
        })
    return pd.DataFrame(scores,columns=['model','best score','best params'])
find best model using gridsearchev(X,y)
```

	model	best_score	best_params
0	linear_regression	0.847796	{'normalize': False}
1	lasso	0.726738	{'alpha': 2, 'selection': 'cyclic'}
2	decision tree	0.716064	{'criterion': 'friedman mse', 'splitter': 'best'}

Based on above results we can say that LinearRegression gives the best score. Hence we will use that.

#### Test the model for few properties

```
def predict_price(location, sqft, bath, bhk):
    loc_index = np.where(X.columns==location)[0][0]

x = np.zeros(len(X.columns))
x[0] = sqft
x[1] = bath
x[2] = bhk
if loc_index >= 0:
    x[loc_index] = 1

return lr_clf.predict([x])[0]

predict_price('1st Phase JP Nagar', 1000, 2, 2)

83.86570258311222

predict_price('1st Phase JP Nagar', 1000, 3, 3)

86.08062284985995
```

```
predict price('Indira Nagar',1000, 2, 2)
```

193.31197733179556

```
predict_price('Indira Nagar',1000, 3, 3)
```

195.52689759854331

#### Export the tested model to a pickle file

```
import pickle
with open('banglore_home_prices_model.pickle','wb') as f:
    pickle.dump(lr_clf,f)
```

# Export location and column information to a file that will be useful later on in our prediction application

```
import json
columns = {
    'data_columns' : [col.lower() for col in X.columns]
}
with open("columns.json","w") as f:
    f.write(json.dumps(columns))
```
